CURRENT
VERSION

01 CONCEPT | 02 SETUP RULES | 03 ENTRIES | 04 STOPS | 05 TARGETS

01 The Concept

Price in the first 20 minutes of the session defines the battleground. Every meaningful move of the day begins by breaking one of those two levels. This strategy does one thing: identifies which side is likely to win, enters when it confirms, and manages the position through the natural cross-back rhythm of the market.

THE OR

9:50

Opening Range is defined by the **9:30–9:50 ET window** — 4 candles. High = max high, Low = min low. The range itself is treated as a single composite candlestick with open, close, body and wicks.

THE BREAK

100%

Every single session in the dataset broke at least one OR level. **Containment never occurred.** The only question is which side breaks, how far it travels, and whether it holds or fades back inside.

THE EDGE

73%

When the strategy reaches its limit target, it wins **73% of the time**. The direction logic works. The challenge is surviving normal cross-back behavior without being exited prematurely.

What the strategy is NOT: It is not a scalp. It is not a fade. It does not trade inside the OR range. It waits for the range to complete, classifies the likely direction using the OR's shape and body characteristics, then enters on the break and retest cycle that follows.

Each trade is independent — E0, E1, E2 are not pyramid additions to the same position. They are separate trades with separate stops and targets, each justified by its own entry signal.

SESSION FLOW

9:30–9:50 — OR builds · no trading

9:50 — OR classified · wait for break

9:50–10:30 — break + E0 entry window

10:00–12:00 — primary retouch window

15:30 — no new entries after this

02

Setup Rules

Before any entry is considered, three filters must pass at 9:50 ET. These are not optional fine-tuning — they represent the highest-signal conditions identified in the data.

FILTER 1 — OR REGIME

NARROW (82–120pts): 25% of days. Almost never fades. Time-based stops only.

MEDIUM (120–200pts): 63% of days. Base case. Full price-based framework.

WIDE (200+pts): 12% of days. Day closes UP 100%. Hard cap 0.5× target.

FILTER 2 — OR SHAPE

Allow: V-Shape (1.32× median), INV-V (0.91×), Weak Up (0.65×), Strong Down (1.20×)

Default OFF: Strong Up (max ever 0.86×, never reached 1.0×), Weak Down (75% fade rate)

Shape is detected from the close-to-close sequence of 4 OR candles.

FILTER 3 — CONVICTION SCORE

Score 0–5 based on OR body properties. Minimum 3 required by default.

- +1 body direction aligned with break
- +1 close in top/bottom 30% of range
- +1 pattern matches break direction
- +1 width is NARROW or MEDIUM

+1 body size $\geq 30\%$ of OR range

Score 3 days trend 93% of the time. *Score 2 days are 50/50 — essentially noise. The minimum score of 3 is the single most important filter in the strategy.*

NEVER TRADE THESE SETUPS

Weak Down pattern — 75% fade rate

Strong Up pattern — never reached 1.0× excursion

MEDIUM + misaligned body — 55% fade rate (n=11)

Score ≤ 2 — 50/50 odds

Break candle after 10:30 ET — 40% fade rate

COMPOSITE CANDLE — WHAT TO READ

Body direction predicts break on 84% of bullish trend days

Close in top 30% → broke HIGH 76% of sessions

Close in bottom 30% → broke LOW 78%

Body size $>30\%$ → committed move, lower fade risk

Body $<15\%$ → indecision, 42% fade rate

03

Entry Types

Three entry types cover the full life of a trend day. Each is independent — they run their own stops and targets and are not additions to the same position.

E0

Break Close

E1

Retouch 1

E2

Retouch 2

TRIGGER

Close of the candle that first breaks OR High/Low by **>5pts**

Price returns within **10pts** of broken level AND next close is outside

Second return to within **10pts** of broken level AND close outside

REMAINING EXC.

-- --

0.83× OR range

0.81× OR range

0.66× OR range

INITIAL STOP

OR Low (upside) or OR High (downside)

OR Midpoint

OR Midpoint

E3+ LATE RETOUCHES (OFF BY DEFAULT)

Available from the 3rd retouch onwards. Remaining excursion at R3 = **0.55×**, R4 = **0.47×**. Day character has changed — it is a grinder. Target is a flat **50pts** from entry, not a pattern multiple. Stop stays at midpoint. Reduce position size. Best used only when score ≥ 4 and width is NARROW or MEDIUM.

RETOUCH COUNT SIGNAL

Days with **0–1 retouches** have 1.05× median total excursion. Days with **5+ retouches** have 0.71× median. When 5 retouches are observed, the target cap automatically reduces to **0.5× OR range**. The retouch count is a real-time quality signal — more retouches = smaller ultimate move.

04

Stop Management

Stops are regime-specific. The same price level means different things on a 90pt NARROW OR vs a 180pt MEDIUM OR. Initial placement and ratchet triggers are different for each width.

NARROW OR (82-120PTS)

Problem: Midpoint stop fails on 67% of winning trend days — adverse routinely exceeds 90% of OR range.

Solution: Time-based stop is primary. If price crosses back through OR level within 20 minutes of the break → exit. OR Low is the backstop price stop.

Adjustment: Only move stop to broken level after +1.0× OR range. Earlier triggers are hit constantly on winning days.

MEDIUM OR (120-200PTS) ★ BASE CASE

E0 initial stop: OR Low. Survives 70% of winning trend days.

E1/E2 initial stop: OR Midpoint. +34pp net signal — catches 90% of fades, survives 56% of trends.

Ratchet (E0): Three-step trigger: +0.5× → midpoint, +0.75× → broken level, +1.0× confirm.

Ratchet (E1/E2): At +0.75× → move stop to broken level.

WIDE OR (200+PTS)

Initial stop: OR Midpoint. OR Low is 200+ pts away — too far for a 0.5× target.

BE trigger earlier: At +0.40× (not 0.75×). Because the entire day's expected move is only 0.5×, BE must be taken sooner proportionally.

Note: Wide OR days close UP 100% of the time — hold directional long bias even after adverse moves.

Medium OR — E0 Stop Ratchet

TRIGGER

+0.50× OR

E0: Move stop from OR Low → OR Midpoint

After +0.50×, 64% of days still came back to OR High (broken level) — too early to go to breakeven. Midpoint is the right intermediate step. Only 24% of days come back to the

midpoint after reaching this milestone. **E0 ONLY**

TRIGGER

+0.75× OR

E0: Move stop to broken OR level (near breakeven) • E1/E2: Move from midpoint to broken level

After +0.75×, only 25% of days came back to the broken level. Risk is now strongly asymmetric in your favour. V-Shape pattern specifically: only 12% come back at this trigger.

E0 E1 E2

TRIGGER

+1.00× OR

All entries: Confirm stop at broken level • Check for clean break upgrade

Only 25% come back from here. Median additional gain still 111pts after reaching 1.0×. If 30 min have passed since break with no retest → clean break confirmed → upgrade target to 2.0×+.

E0 E1 E2

STRONG UP PATTERN OVERRIDE (ALL REGIMES)

When OR pattern is Strong Up, initial stop is always OR Low regardless of width setting. The midpoint stop fails on 40% of Strong Up trend days. This is the most dangerous pattern for stop placement — the OR range was built by directional price action that consumed the early energy.

05

Target *Logic*

Targets are multiples of OR range beyond the broken level — not fixed points. A 0.75× target on a 200pt OR is 150pts of travel from OR High. All targets are set at entry and adjusted upward only (never reduced manually — only by retouch count modifier).

Pattern-based TPI targets

V-Shape ↓↑

TP1: 1.10× · TP2 (clean): 2.00×
Median exc: 1.32× · Reach 1.0×: 54%

Best setup. The dip during OR builds fuel. 31% clean break rate — highest of any pattern.
Trail hard after 1.0×.

INV-V ↑↓

TP1: 0.75× · Trail after
Median exc: 0.91× · Max: 3.64×

Fat tail possible. **Do not trail tight.** Use trailing stop at broken level after TP1. Stop retouches after R3.

Weak Up ↑

TP1: 0.50× partial · Trail rest
Median exc: 0.65× · R count: median 11

Grinder day. 91% reach 0.5×. Take partial at TP1, trail remainder. Reduce E3+ targets.

Strong Up ↑↑↑

Cap: 0.43× · Max ever: 0.86×
Never reached 1.0×: 0/5 days

Take 0.43× and exit. Energy consumed building the OR. Do not hold for large moves.

Strong Down ↓↓↓

TP1: 1.20× · n=3 (hypothesis)
Adverse median: 242pts

High target but brutal adverse on winning days. OR Low stop only. Low confidence — n=3.

WIDE OR any pattern

Hard cap: 0.50× regardless

Never exceeded 1.0×: 0/7 days

Absolute cap. 0.5× on 240pt OR = 120pts absolute. Still a full trade — just a different multiple.

Target modifiers

01 E2 target decay (default: ×0.80)

E2 entries have 0.66× remaining vs 0.81× for E1. Automatically multiplies pattern target by 0.80 for E2 entries. V-Shape E2 cap = $1.10 \times 0.80 = 0.88\times$. Can be disabled.

02 Retouch count cap (≥5 retouches)

When the session retouch count reaches 5, all open targets are capped at 0.5× OR range. Day median drops from 1.05× to 0.71× once 5+ retouches are observed.

03 Clean break upgrade (30 min no retest)

If 30 minutes pass after the break with no approach within 10pts of broken level → upgrade all targets to 2.0× (or V-Shape TP2 = 2.00×). Clean break median: 2.12×. Median additional gain after 1.0× = 111pts.

04 Weak Up partial exit

When pattern is Weak Up and trail toggle is on, 50% of position exits at TP1. The remaining 50% trails with stop at the broken OR level. Designed for the bimodal nature of Weak Up days — either stops early or runs large.

06 Override *Exits*

Four exit types can close all open positions regardless of where stops or targets are. These are emergency exits driven by price behavior, not level-based stops. They fire immediately when triggered and cannot be partially applied.

OPPOSITE OR LEVEL TESTED — IMMEDIATE EXIT

If price comes within **10pts of the opposite OR level** (OR Low for an upside break, OR High for a downside break) — exit all entries immediately.

Data: days where the opposite OR level was tested had median primary excursion of only **0.44×** vs **1.03×** on days that did not. The opposite level test is the single strongest failure signal in the dataset. No exceptions.

DEEP CROSS-BACK — CONDITIONAL EXIT (V5 IMPROVED)

Fires when: depth of cross-back **>30%** of OR range AND has been inside range for **>8 bars** (40 min).

v5 FAE guard: suppressed if max FAE $\geq 0.5 \times$ OR range — the ratchet stop is already protecting the position. **v5 E2 off by default** — midpoint stop handles E2 exits. **v5 E0-only time stop** — E1/E2 time stops removed as they had 0% win rate.

SHALLOW HOLD — DO NOT EXIT

Cross-back depth **<20%** of OR range AND duration **<2 bars** = shallow retest. **Do not fire Deep Exit in this case.**

63% of all cross-backs on trend days are this shallow and resolve back outside within 1-2 bars. Exiting here is the single most common source of premature exit losses.

SESSION END — FORCED CLOSE

All open positions closed at **15:30 ET** regardless of status. Session end exits in the backtest averaged **-\$52** each — these are late-day positions that drifted. Use the session end time input to close earlier if desired. Session end before 14:00 materially improves results.

HOLD SIGNAL — WHAT NOT TO EXIT ON

The most expensive mistake in the backtest was exiting during normal cross-back behavior. If you see a cross-back that is shallow (<20% depth) and resolves within 2 bars — this is normal trend-day behavior. 65% of all trend days involve multiple cross-backs. Episode 2 cross-backs (the second time price returns to the OR level) are consistently the shallowest of any episode — median 10.6% depth. These are re-entry signals, not exit signals.

07 OR Patterns

The 4 OR candles (9:30, 9:35, 9:40, 9:45) classified by their close-to-close sequence. The pattern sets your target, influences your stop placement, and determines which entry types are worth taking.

Pattern identification rules

↑↑↑

STRONG UP — all four closes higher

$c1 < c2 < c3 < c4$. Committed upside throughout. Counterintuitively the worst target — energy consumed building range. Never exceeded 0.86× in dataset. Default filter OFF.

↓↓↓

STRONG DOWN — all four closes lower

$c1 > c2 > c3 > c4$. Mirror of above. Better target (1.20×) but severe adverse. Low sample (n=3). OR Low stop required.

↓↑

V-SHAPE — dips then recovers

$c2 < c1$ AND $c4 > c2$. The best-performing pattern. The dip creates fuel. 1.32× median, 31% clean break rate. Bull body typically confirms upside break.

↑↓

INV-V — rises then falls

$c2 > c1$ AND $c4 < c2$. Fat tail possible (3.64× max). Wide outcome variance. Use

trailing stop rather than fixed TP2. Stop entries after R3.

WEAK UP — $c4 > c1$ but not strong

Neither strong nor V-shaped. Grinder day — median 11 retouches, $0.65\times$ excursion. Take partial at $0.5\times$, trail rest. Do not hold for large targets.

WEAK DOWN — $c4 < c1$ but not strong

75% fade rate. Default filter OFF. If taken, treat with extreme caution and very tight target. Not recommended.

COMPOSITE CANDLE ANATOMY

Open = 9:30 candle open

Close = 9:45 candle close

High = max of all 4 highs = OR High

Low = min of all 4 lows = OR Low

Body = $|\text{Close} - \text{Open}|$

Upper wick = $\text{OR High} - \max(\text{O}, \text{C})$

Lower wick = $\min(\text{O}, \text{C}) - \text{OR Low}$

The composite candle is drawn automatically on chart when show_composite is ON.

Labels show pattern, regime, OR range in points, and upper/lower wick percentages.

REGIME × PATTERN — BEST COMBINATIONS

V-Shape + Medium: $1.70\times$ median, $n=8$ ★★

Weak Up + Narrow: $1.84\times$ median, 0% fade, $n=4$ ★

Strong Up + Medium: 75% range day rate — AVOID

Any + Wide: cap $0.5\times$ regardless of pattern

All inputs are organized into three top-level categories: Setup (what to trade), Entries (how to get in), and Exits (how to get out). Every meaningful threshold is exposed — nothing is hardcoded.

SETUP — OR WINDOW

SETUP

PARAMETER	DEFAULT	DESCRIPTION
or_start_hour/min	9:30	OR window start. Leave at 9:30 ET for standard session open.
or_end_hour/min	9:50	OR window end. 9:50 = peak tested-rate from data (93%). Adjustable to 10:00 or 10:15 for different OR definitions.
session_end_hour/min	15:30	No new entries after this time. All positions close at this time. Earlier values (e.g. 14:00) reduce late-day drift losses.
tz_input	America/New_York	Timezone for all time comparisons. Must match broker time offset if chart is not in ET.

SETUP — OR REGIME WIDTH

SETUP

PARAMETER	DEFAULT	DESCRIPTION
narrow_max	120	ORs below this value are classified NARROW. Different stop and ratchet logic applies. 82–120pts in dataset.
medium_max	200	ORs between narrow_max and this value are MEDIUM (base case). Above this = WIDE. 120–200pts in dataset.

SETUP — OR SHAPE FILTER

SETUP

PARAMETER	DEFAULT	DESCRIPTION
enable_shape_filter	true	Master toggle for pattern filtering. Disable to

		trade all patterns regardless of shape.
allow_v_shape	true	V-Shape pattern. Best performing — 1.32× median. Keep ON.
allow_inv_v	true	INV-V pattern. 0.91× median but fat tail possible. Keep ON.
allow_weak_up	true	Weak Up pattern. Grinder days, 0.65× median but 91% reach 0.5× target. Keep ON with adjusted targets.
allow_weak_down	false	75% fade rate. Default OFF. Enable only if testing edge cases.
allow_strong_up	false	Never exceeded 0.86× excursion in dataset. Default OFF. If enabled, hard cap applies at tp_strong_up_tp1.
allow_strong_down	true	Strong Down. 1.20× median target but severe adverse (242pts median). n=3 — hypothesis only.

SETUP — CONVICTION SCORE

SETUP

PARAMETER	DEFAULT	DESCRIPTION
enable_score_filter	true	Master toggle. Disable to trade all setups regardless of composite candle quality.
min_score	3	Most important filter. Score 3 = 93% trend rate. Score 2 = 50/50. Range 0–5. Raise to 4 for ultra-high-conviction only mode.
score_body_aligned	true	+1 if body direction matches break direction. Misaligned body on MEDIUM = 55% fade rate.
score_close_pos	true	+1 if 9:45 close in top/bottom X% of OR range. Close top 30% → broke HIGH 76%.
score_pat_aligned	true	+1 if pattern matches break direction (e.g. V-Shape breaking upside = aligned).
score_width_ok	true	+1 if regime is NARROW or MEDIUM (not

		WIDE). WIDE ORs have capped targets.
score_body_size	true	+1 if body size $\geq$ body_size_min fraction of OR range.
body_size_min	0.30	Minimum body fraction for score point. 0.30 = body must be $\geq$ 30% of OR range. Body <15% = 42% fade rate.
close_pos_threshold	0.30	Top/bottom zone fraction. 0.30 = top 30% and bottom 30% qualify for the close-position score point.

ENTRIES — WHICH TO TAKE

ENTRIES

PARAMETER	DEFAULT	DESCRIPTION
enable_e0	true	Break candle close entry. Available 100% of days. Disable to test retouch-only strategies.
enable_e1	true	First retouch entry. Available 88% of trend days. 97% success rate.
enable_e2	true	Second retouch entry. Available 77% of trend days. 91% success rate. Target reduced by e2_target_factor.
enable_e3plus	false	Third+ retouch entries. Uses flat pt target (e3_target_pts). Only for high-retouch grinder days.
max_entries_per_day	3	Hard cap per session. Default 3 covers E0+E1+E2. Raise to 4 to include E3+.
break_confirm_pts	5	Pts beyond OR level required to confirm break. Lower for earlier entries, higher to reduce false breaks.
retouch_touch_zone	10	How close to broken level price must come for a retouch to count. 10pts = within one tick range on MNQ.

PARAMETER	DEFAULT	DESCRIPTION
tp_v_shape_tp1	1.10	V-Shape first target as xOR range beyond broken level. Data median: 1.32x — conservative start.
tp_v_shape_tp2	2.00	V-Shape clean break target. Only used when clean_break_act fires.
tp_inv_v_tp1	0.75	INV-V target. Trail after this level using broken OR level as floor.
tp_weak_up_tp1	0.50	Weak Up partial exit target. 91% of trend days reach 0.5x. Trail remainder if tp_weak_up_trail = true.
tp_strong_up_tp1	0.43	Strong Up hard cap. Never exceeded 0.86x in dataset. Take this and exit — do not hold.
tp_strong_down_tp1	1.20	Strong Down target. Data median 1.20x but n=3. Treat as hypothesis.
tp_wide_cap	0.50	WIDE OR absolute cap. Overrides pattern target. Never exceeded 1.0x in dataset regardless of pattern.

PARAMETER	DEFAULT	DESCRIPTION
enable_clean_break	true	Enables the 30-min clean break detection and target upgrade.
clean_break_mins	30	Minutes after break with no retest = clean break. On 5-min chart: 30 min = 6 bars. 75% of normal retests happen within 25 min.
clean_break_retest_zone	10	Any approach within this many pts of broken level disqualifies clean break. Same as retouch zone.

clean_break_target	2.00	Target multiplier on confirmed clean break. Dataset clean break median: 2.12×.
--------------------	------	--

EXITS — INITIAL STOP LEVELS

EXITS

PARAMETER	DEFAULT	DESCRIPTION
narrow_stop_type	BOTH	NARROW OR stop approach. OR_LOW = price stop only. TIME_BASED = time stop only. BOTH = time primary + OR Low backstop. BOTH is recommended.
medium_e0_stop	OR_LOW	E0 initial stop on MEDIUM OR. OR_LOW = full range away (survives 70% of trend days). MIDPOINT = tighter but fails more often at E0.
medium_e1e2_stop	MIDPOINT	Key setting. Midpoint stop on E1/E2 MEDIUM ORs. Catches 90% of fades, survives 56% of trends. +34pp net signal.
wide_stop_type	MIDPOINT	WIDE OR initial stop. OR_LOW is 200+ pts away — disproportionate to 0.5× target. Midpoint recommended.

EXITS — NARROW OR TIME STOP

EXITS

PARAMETER	DEFAULT	DESCRIPTION
narrow_time_stop_mins	20	Exit window after break. If price crosses back within N minutes = false break, exit. On 5-min chart: 20 min = 4 bars.
narrow_time_stop_e0_only	true	v5 fix. When ON, time stop only applies while E1 has not yet been entered (na(e1_stop) = true). E1/E2 time stop losses were 0% win rate — 19 trades, – \$975.

EXITS — DEEP CROSS-BACK

EXITS

--	--	--

PARAMETER	DEFAULT	DESCRIPTION
enable_deep_crossback_exit	true	Master toggle for deep cross-back exit logic.
crossback_depth_exit	0.30	Depth threshold as fraction of OR range. 0.30 = price must close 30%+ of OR range back inside the range. 70% of cross-backs on trend days are shallower than this.
crossback_dur_exit	8	v5: changed from 4 to 8. Number of bars inside range required. On 5-min chart: 8 bars = 40 min. v4 used 4 bars = 20 min which matched the median trend-day cross-back duration, causing false exits.
enable_shallow_hold	true	Bypass deep exit for shallow quick retests (depth < shallow_depth_max AND duration < shallow_duration_max). Prevents exiting normal trend behavior.
shallow_depth_max	0.20	Maximum depth fraction for shallow hold bypass. 0.20 = 20% of OR range. Deeper = not shallow.
shallow_duration_max	2	Maximum bars inside range for shallow hold. 2 bars = 10 min. Longer = not shallow.
deep_exit_fae_guard	0.50	v5 fix. Suppresses deep exit if max_fav_exc $\geq$ this fraction $\times$ OR range. When 0.50: if trade moved 0.5 $\times$ OR in our favour first, stop ratchet is protecting — deep exit is overridden. Set 0.0 to disable (v4 behavior).
deep_exit_e0	true	Deep exit applies to open E0 positions.
deep_exit_e1	true	Deep exit applies to open E1 positions.

deep_exit_e2	false	v5 fix — off by default. E2 has midpoint stop as initial protection. Deep exit on E2 was 0% win rate. Midpoint stop already defines invalidation.
--------------	-------	--

09 Backtest *Guide*

How to use the settings to isolate, test, and improve individual components of the strategy without changing the overall framework.

Testing the filters in isolation

A **Test conviction score threshold**

Set min_score to 0, 2, 3, 4, 5 and compare trade count vs profit factor. Score 3 = 93% trend rate in original data. In backtest, compare win rate across score levels to validate.

B **Test pattern filters individually**

Enable only one pattern at a time (e.g. allow_v_shape = true, all others false). Compare results across patterns to validate data findings. V-Shape should outperform Strong Up significantly.

C **Test entry types independently**

Set enable_e0 = true, enable_e1 = false, enable_e2 = false to test E0-only performance. Then reverse. E0+E2_X exit combination showed 100% win rate (16 trades) — verify this holds.

D **Test v5 fixes vs v4**

Set deep_exit_fae_guard = 0.0, deep_exit_e2 = true, narrow_time_stop_e0_only = false to reproduce v4 behavior. Compare vs defaults to quantify improvement of each fix.

Key metrics to watch

- ☐ **Deep Exit count:** Should decrease from 52 (v4) with default v5 settings
- ☐ **Time Stop E1/E2 count:** Should be 0 with narrow_time_stop_e0_only = true
- ☐ **Target exit win rate:** Should stay ~73% (_X exits)
- ☐ **Profit factor:** Baseline v4 = 1.01 — target >1.10 in v5
- ☐ **Max drawdown:** Watch Nov–Jan period. Regime-sensitive.
- ☐ **Entries before 9:50 ET:** Must be 0 — code validation check
- ☐ **Max entries per day:** Must never exceed max_entries_per_day setting
- ☐ **Session end exits:** Should be minimal — these average –\$52 each

RECOMMENDED FIRST BACKTEST SETTINGS

Defaults as shipped are the data-validated starting point.

First test variation: **session_end_hour = 14** (close before PM drift)

Second: **min_score = 4** (ultra-high conviction only)

Third: **enable_e3plus = true** (add late retouches)

Fourth: **deep_exit_fae_guard = 0.75** (wider FAE protection)
